Body Shaping Roller Device

Hands-Free Operation | Fully Automatic Rolling & Pressing

Full-Body Coverage

Back / Arms / Waist & Abdomen / Legs / Buttocks

Lymphatic Circulation Stagnation

Slow Metabolism

Tense & Stiff Muscles

Full-Body Contouring

Daily Body Management

Ⅰ. Product Overview

I. Product Overview

The Body Sculpting Roller Massager is an innovative physical shaping device designed for comprehensive body contouring. Its core technology is based on multi-dimensional rotating mechanical stimulation. Through gentle yet precise action of the rollers on muscles and subcutaneous soft tissues, it achieves whole-body lymphatic drainage activation and simultaneously enhances blood circulation and metabolism. This effectively alleviates swelling and a feeling of heaviness in the body, while relaxing tense muscles, optimizing body contours, and improving skin firmness. It provides a safe, comfortable, and efficient solution for body conditioning and daily posture management. The device is suitable for professional slimming treatments in beauty salons, post-exercise muscle recovery in gyms, and daily personal body care.

1.2 Technology and Working Principle

The Body Sculpting Roller Massager achieves comprehensive results—including deep muscle relaxation, circulatory decongestion, promotion of fat metabolism, and posture optimization—through large- area physical rolling compression and multi- point pressure application. It is a non- invasive, gentle full- body physiotherapy device.

Centered on physical rolling compression, multi- point pressure, and bionic massage, the mechanical motion of the rollers delivers integrated therapeutic effects on the muscles, fascia, and subcutaneous tissues throughout the body. The specific principles are as follows:

1. Deep Fascial Release and Muscle Relaxation

- Multiple sets of rollers (or rollers with raised nodules) rotate synchronously, mimicking the "pushing, pressing, kneading, and pinching" techniques of professional massage therapists, delivering large- area, multi- angle physical stimulation.
- The raised nodules increase localized pressure, enabling precise action on tender muscle points and fascial adhesions. This deeply releases tense fascia and muscle knots, alleviates muscle stiffness, "dowager's hump," and lower back pain, while promoting overall relaxation and improving posture.

2. Principle of Circulatory Activation

The rhythmic compression during rolling:

- Accelerates blood circulation, enhances local oxygen and nutrient supply, and promotes the elimination of metabolic waste products such as lactic acid, relieving post- exercise soreness and fatigue caused by prolonged sitting;
- Unblocks lymphatic circulation, helping the body expel excess fluid and toxins, reducing systemic edema (especially in the legs and abdomen) and cellulite, while improving skin radiance and tightening body contours.

3. Dual Mechanism of Contouring and Soothing

- Gentle compression of the subcutaneous fat layer: helps break down localized fat deposits and promotes fat metabolism; with regular use, it helps optimize body contours (e.g., firming the waist, abdomen, and leg lines).
- Fascial stretching and release: the rolling action stretches deep fascia, relieving postural stiffness caused by fascial adhesions and creating smoother body lines.
- Enhanced skin elasticity: continuous mechanical stimulation activates collagen regeneration in the dermis, increases skin elasticity, and reduces sagging.

4. Neuromodulatory Principle for Physical and Mental Relaxation

- The gentle vibration and pressure generated by rolling stimulate cutaneous tactile nerves, transmitting "relaxation signals" to the central nervous system. This reduces sympathetic nervous system activity, alleviates anxiety, and improves sleep quality.

1.3 Scope of Application

Applicable Users and Scenarios:

- Fitness enthusiasts: post-exercise muscle relaxation, relief of soreness, accelerated recovery, and prevention of sports injuries.

- Sedentary office workers: alleviates lower back stiffness, shoulder and neck strain, and prevents postural issues such as rounded shoulders and hunched back.

- Individuals seeking body contouring: helps improve localized fat accumulation and the appearance of cellulite, optimizes body contours, and supports shaping management.

- Individuals focused on daily wellness: promotes systemic blood circulation, relieves fatigue, enhances physical vitality, and improves sleep quality.

- Middle-aged and elderly individuals: soothes joint and muscle pain, enhances physical flexibility, and improves quality of life.

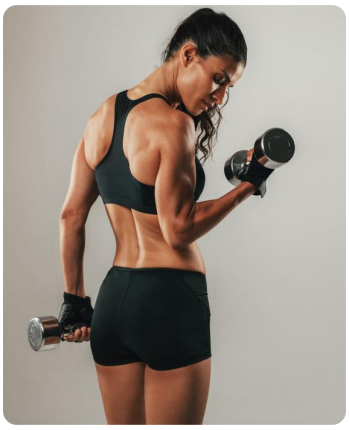

Figure 4

1.4 Operating Parameter Settings

•The instrument's operating parameters are simple and easy to adjust. Different roller speeds are applied according to the treatment goals and target areas. For first-time use, the default setting is low speed, which can be gradually increased based on user tolerance. The specific parameter specifications are as follows:

Area	Duration (per session)	Intensity (Level)	Treatment Frequency (per week)
Back	8-10 minutes		3-4 times per week
Waist sides	8-10 minutes		3-4 times per week
Abdomen	5-8 minutes		3-4 times per week
Buttocks	8-10 minutes		3-4 times per week
Thighs	8-10 minutes		3-4 times per week
Calves	8-10 minutes		3-4 times per week
Arms	5-6 minutes		3-4 times per week

Note: For full-body comprehensive treatment, the total operating time is recommended to be kept within 60 minutes to avoid overstimulation. During operation, the rollers should remain in motion, following the direction of the body's lymphatic flow.

1.5 Core Advantages

1) Multi-functional integration: Combines muscle relaxation, lymphatic decongestion, fat reduction and body contouring, and circulation promotion into one device, meeting multiple needs with a single piece of equipment.

2) Deep- acting effect: Mechanical rolling combined with infrared heat therapy penetrates deeply into muscles and fascia, delivering superior results compared to ordinary surface massage.

3) Comfortable and efficient: The roller design simulates professional massage techniques, covering large areas to achieve full- body relaxation in a short time, allowing hands- free operation and maximizing efficiency.

4) Safe and non-invasive: non-invasive, widely applicable to various groups of people, comfortable to use, and causing no significant pain.

5) Premium experience: With popular equipment from high-end fitness facilities in Europe and America, you can enjoy professional-level physiotherapy and body shaping experience at home.

6) Deep relaxation across multiple scenarios: Quickly relieves muscle tension after exercise, alleviates lower back stiffness for office workers, and reduces overall fatigue for daily wellness.

7) Aids in body contouring management: Helps improve localized fat accumulation and the appearance of cellulite, assists in optimizing body contours, and enhances skin firmness.

8) Enhances circulation and metabolism: Promotes systemic blood circulation and lymphatic flow, accelerates the elimination of metabolic waste, and alleviates circulation- related issues such as cold hands and feet.

9) Improves posture and muscle strain: Relieves muscle strain and fascial adhesions, assists in correcting poor posture, and reduces physical stress caused by prolonged sitting or exercise.

10) Convenient and efficient operation: Features one- touch mode switching to

accommodate different body areas and needs, allowing users to enjoy professional- grade care at home without additional time investment.

11) Gentle and comfortable experience: Non- invasive treatment with a mild, non- irritating process, suitable for individuals with sensitive skin as well as the general population. Long- term maintenance value: Consistent use enhances physical vitality and muscle elasticity, delays age- related decline in bodily functions, and helps achieve a healthy physique.

1.6 Comparative Product Advantages

1) Higher operational efficiency: Optimized roller rotation structure and contact area increase lymphatic drainage efficiency by 30% compared to other products, delivering more significant decongestion and circulation improvement effects.

2) Enhanced user experience: Precisely controlled roller damping provides gentler stimulation with no stinging or painful sensation, resulting in better user tolerance.

3) Greater adaptability: Multi- speed and multi- area adaptable design with bidirectional rotation for high flexibility. It meets the treatment needs of various body areas including shoulders, back, limbs, and torso

4) Superior battery life and energy efficiency: Low- power energy- saving design extends continuous operating time by 50% compared to other products, making it more suitable for beauty salons, gyms, home wellness use, and rehabilitation facilities.

5) Better durability: The rollers are made of highly wear- resistant materials, and the housing is scratch- resistant and drop- resistant, ensuring a longer service life.

6) Stronger power performance: Equipped with a high- torque drive motor, the maximum rotation speed is significantly higher than that of similar products, and it supports precise multi- speed adjustment to meet both superficial drainage and deep muscle release requirements.

7) Improved interactive experience: Features a larger high- definition touchscreen with an intuitive and clear interface, greatly enhancing professional service efficiency.

8) More stable power frequency: Utilizes intelligent variable- frequency power technology to maintain a constant operating frequency without jerking, delivering uniform and stable energy output. This prevents localized

overstimulation and ensures safe and effective treatment throughout the entire session.

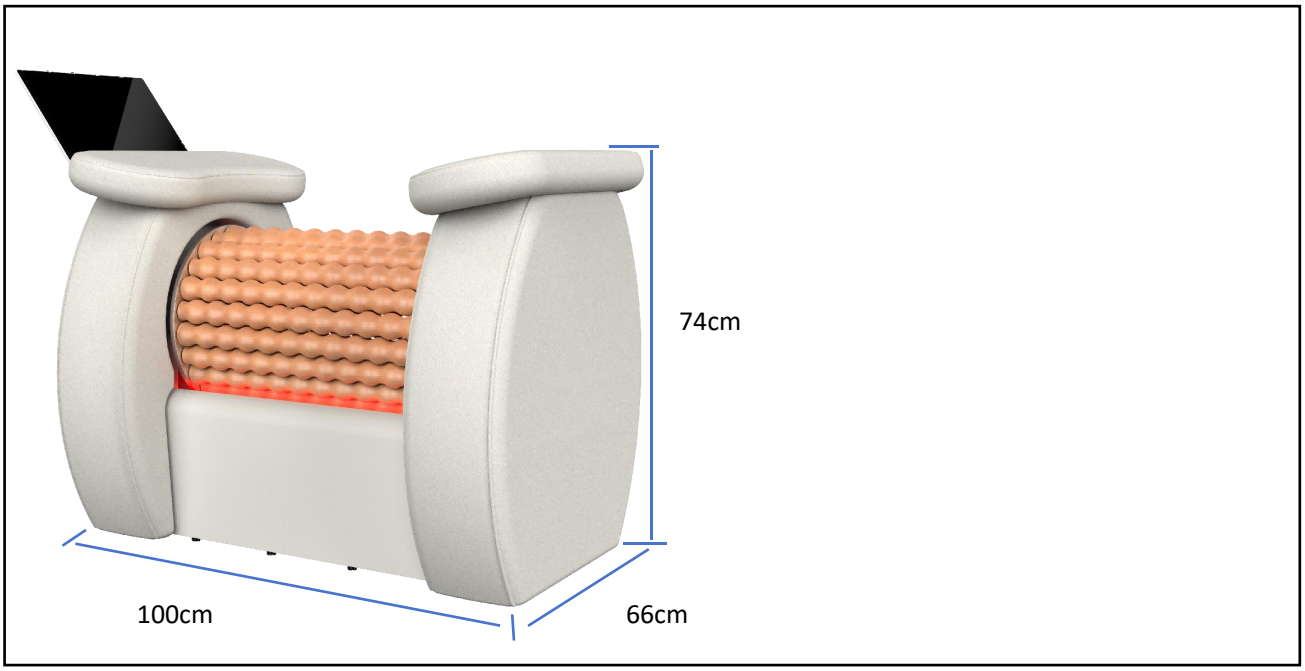

9） Better noise control: Designed with a silent motor and vibration- damping structure, operating noise is significantly reduced, creating a quiet and comfortable environment suitable for noise- sensitive settings such as high-end clubs and homes.

10） Effortless operation: Hands- free with no need to manually hold the device; the fully automatic roller rolling design allows for easy coverage of all body areas, enabling an immersive massage and contouring experience.

1.7 Product Core Parameters

Item	Specifications/Parameters
Product Name	Body Shaping Roller Massager
Screen	15.6 inches
Roller Speed	200 rpm
Operating Voltage	100-240V
Power	500w
Unit Dimensions	Length 100 x Width 66 x Height 74 (cm)
Packaging Dimensions	Length 114 x Width 77 x Height 88 (cm)
Packaging Weight	93KG

Packaging:

*Specifications are subject to change or adjustment without prior notice.

II. Contraindications and Cautions

2.1 Absolute Contraindications

1) Pregnant or breastfeeding women; women during menstruation (for abdominal procedures).

2) Those with skin damage, ulcers, infections, or in the acute phase of inflammation (e.g., acne with redness, eczema, herpes zoster); those with acute trauma or unhealed wounds.

3) Those with severe cardiovascular or cerebrovascular diseases (heart failure, arrhythmia, uncontrolled severe hypertension), coagulation disorders (hemophilia, long-term use of anticoagulant medications).

4) Those with malignant tumors, or with medical implants such as pacemakers, metal stents, or prostheses.

5) Those in the acute phase of lymphatic system diseases (lymphangitis, tuberculous lymphadenitis), or with venous thrombosis.

6) Those with high fever (≥ 38°C) or in the acute phase of infectious diseases; those who are extremely weak or have moderate to severe anemia.

7) Those allergic to the material of the device that contacts the skin; those with advanced osteoporosis; those with extremely low tolerance to physical mechanical stimulation.

8) Diabetic patients, especially those with diabetic peripheral neuropathy

9) Those with sensitive skin, keloid-prone constitution, or excessively thin stratum corneum.

10) Those who have undergone local surgery, liposuction, or injectable aesthetic procedures within the past three months; those who have received fillers such as hyaluronic acid or botulinum toxin should wait at least six months before use.

11) Do not use simultaneously with other high-frequency or radiofrequency devices on the same area.

12) Those who have not fully recovered from childbirth, including within 3 months after vaginal delivery or within 6 months after cesarean section

13) Those with cysts, nodules, or lipomas of undetermined nature in the area to be treated.

14) Do not use on the waist or abdomen within 1 hour after alcohol consumption, or when fasting or overly full.

Precautions:

1）Do not place hands/feet into the roller gap.

2）Those with long hair must tie it up to prevent it from hanging into the gap and getting tangled.

3）Wear tight-fitting shapewear when using the device.

As shown in the figure below:

Correct Demonstration

Incorrect Demonstration

III. Operating Procedure

3.1 Standard Operating Steps

1) Pre-operation inspection: Verify that the device exterior, power cord, and roller assembly are free from damage, that the rollers rotate smoothly without jamming or abnormal noise, and that all accessories are present.

2) Power-on self-test: Connect the power supply, turn on the main switch, wait for the system self-test to complete, after which the device enters standby mode.

3) Parameter setting: Select the appropriate roller speed and timing mode on the touchscreen according to the treatment goal, target area, and user tolerance level.

4) Body and environment preparation:

①The user must wear tight-fitting sportswear.

②Those with long hair must tie it up to prevent it from hanging into the roller gap and getting tangled.

③Prepare 0.5 liters of warm water and a towel, placed within easy reach.

5) Operation: The user adjusts their position to align the target area with the rollers, starts the device, and the rollers operate automatically without manual intervention; ensure the rollers maintain close contact with the skin, roll at a steady speed following the body's lymphatic pathways, and avoid prolonged treatment on a single area.

6) End of operation: The device stops automatically after the set time; if other areas need treatment, simply reset the parameters; continuously check the user's comfort level during operation and pause immediately if any discomfort occurs.

7) Device shutdown: Turn off the device, unplug the power cord, and clean the roller assembly.

3.2 Operating Procedure by Body Area

1) Upper Limbs (Arms)

Direction: Rollers rotate clockwise, moving from wrist toward shoulder (centripetally)

Steps: Forearm from wrist to elbow, upper arm from elbow to shoulder, avoid the axillary lymph nodes

Duration: 5–6 minutes per side

2) Lower Limbs (Thighs / Calves)

Direction: Rollers rotate clockwise, moving from ankle toward the groin (centripetally)

Steps: Calf from ankle to popliteal fossa, thigh from popliteal fossa to inguinal region, roll in sections, repeat each section 3–5 times

Duration: 8–10 minutes per side

3) Abdomen

Direction: Abdomen rolled clockwise; lateral waist rolled from bottom to top (centripetally)

Steps: Abdomen rolled clockwise centered around the navel; waist rolled along both sides of the spine from the hips to the lower rib margin

Duration: 5–8 minutes in total, with gentle pressure

4) Back

Direction: Roll counterclockwise or alternately, moving from bottom to top along both sides of the spine (centripetally)

Direction: Roll counterclockwise or alternately, moving from bottom to top along both sides of the spine (centripetally)

Duration: 8–10 minutes in total

5）Lateral Waist

Direction: Rollers rotate clockwise, moving from the hip toward the lower rib margin (centripetally)

Steps: Relax the erector spinae / lateral waist muscles; operate only along the muscles on both sides of the spine

Duration: 8–10 minutes in total, with very gentle pressure

6）Buttocks

Direction: Rollers rotate counterclockwise, moving from the upper thigh toward the waist and back

Steps: Cover the entire gluteal muscle group; focus can be placed on the upper gluteal line and the gluteus medius area for enhanced effect

Duration: 8–10 minutes in total, with very gentle pressure

3.3 Key Operating Points

1) The rollers must maintain close contact with the skin throughout the operation; avoid operating with the rollers not in full contact. The pressure should be such that the user feels a gentle pressing and rolling sensation; forceful pressing is prohibited.

2) The direction of operation should follow the centripetal lymphatic return direction (limbs → torso, torso → armpits/groin). For the limbs, waist, and abdomen, clockwise direction is primarily used; for the back, counterclockwise or alternating directions may be applied flexibly. Follow the principle of "gentle in the forward direction" and avoid reverse rotation that may impede circulation.

3) Continuously check the user's comfort level during operation. If any discomfort such as skin tingling, worsening redness, or unbearable soreness occurs, immediately pause the operation, identify the cause, and adjust the parameters.

4) Avoid prolonged roller stimulation on bony prominences (kneecap, spine, hip bone, collarbone).

5) When performing a full-body treatment, follow the principle of "treat small areas before large areas, apply light stimulation before heavy stimulation".

6) Abdominal massage should be gentle; avoid abdominal massage within 1 hour after meals to prevent gastrointestinal dysfunction. Do not massage areas with varicose veins or broken skin. For sensitive areas, it is recommended to turn off the infrared function or reduce the roller speed.

7) The device is intended for single-user use at a time.

8) Not for use by minors.

IV. Treatment Cycle

4.1 Duration per Session

1） The duration for a single area is set to 10－25 minutes according to the treatment goal; refer to Section 1.4 Operating Parameter Settings in this manual for details.

2） The duration for a single area is set to 10－25 minutes according to the treatment goal; refer to Section 1.4 Operating Parameter Settings in this manual for details.

4.2 Total Number of Sessions

Based on the severity of the condition, treatment is typically conducted 3–4 times per week, with specific cycle settings as follows:

1） Mild conditions (daily relaxation, mild edema, occasional muscle soreness): 1 basic cycle (5–8 sessions) to help achieve the desired treatment effect.

2） Moderate conditions (noticeable edema, persistent muscle tension, chronic feeling of heaviness): 2–3 basic cycles (10–24 sessions) to gradually improve circulation and muscle condition, and optimize body contours.

3） Severe conditions (severe waist/abdomen or lower limb edema, muscle stiffness with nodules, mild skin laxity): 3–4 basic cycles (24–32 sessions) to deeply stimulate lymphatic and blood circulation, helping to achieve comprehensive results in reducing swelling, relaxing muscles, and body shaping.

4.3 Interval Between Sessions

1） Standard interval: every 2－3 days, allowing sufficient time for the body's lymphatic and circulatory systems to adapt and metabolize, avoiding over-frequent stimulation.

2） Mild relaxation / daily maintenance: can be flexibly adjusted to 1–2 times per week, based on personal comfort.

3） Severe edema / muscle stiffness: initially every other day; after symptoms significantly improve, adjust to once every 3 days, gradually transitioning to the standard interval.

4.4 Maintenance Cycle

1） After completing the basic treatment cycle and achieving the desired results, enter the maintenance phase to preserve body shape and circulation.

2） Those with edema-prone constitution or who sit/stand for long periods: 2–4 times per month.

3） Those focused on daily body shaping maintenance: 1–2 times per month.

4） Office workers, manual laborers, or those prone to muscle tension: adjust flexibly based on feelings of soreness; perform soothing treatment promptly when discomfort occurs.

V. Explanation of Effects

5.1 Phases of Effect Presentation

This device is a physical conditioning device; effects appear gradually over the treatment cycle and are not immediately potent. The time required for effects to manifest varies depending on the treatment goal:

1) De-swelling effects: After a single session, a reduction in the feeling of bodily heaviness is usually noticeable; mild edema (e.g., in the hands) may improve within a few hours. After 3–5 sessions, noticeable improvement can be seen in areas with severe edema, such as the lower limbs, waist, and abdomen.

2) Improved circulation and metabolism: After 1 – 2 treatment cycles, the sensation of soreness and discomfort following prolonged sitting or standing is typically significantly reduced, basal metabolic rate increases, and an overall feeling of lightness is enhanced.

3) Muscle and contouring effects: After 2 – 3 treatment cycles, tense and stiff muscles become relaxed, muscle nodules help dissipate, and body contours become smoother; skin tightness improves, and sensations of sagging or drooping are reduced.

5.2 Key Points for Maintaining Effects

1) The maintenance of the device's conditioning effects is closely related to daily lifestyle habits. Maintaining a low-salt diet, adequate water intake, regular sleep patterns, and moderate exercise can help sustain a light and healthy physique over the long term.

2) Individuals with edema-prone constitution or those who sit/stand for prolonged periods are advised to undergo regular maintenance treatments (2 –4 times per month) to prevent recurrence of edema.

3) Combining with the brand's accompanying body management program (such as massage and stretching guidance) can enhance and prolong the body shaping effects.

VI. Comparison of Effects

VII. Frequently Asked Questions

Q1: What is a Body Shaping Roller Massager?

The Body Shaping Roller Massager is a non-invasive full-body contouring device that uses physical rotating roller stimulation as its core mechanism. Through gentle contact stimulation of muscles and subcutaneous soft tissues, it achieves lymphatic drainage activation, improved blood circulation and metabolism, providing a one-stop solution for issues such as body edema, heaviness, and muscle tension. It also helps relax muscles, enhance skin firmness, and optimize body contours. It is suitable for use in professional beauty institutions and for personal daily body care.

Q2: Who is the Body Shaping Roller Massager suitable for?

It is suitable for individuals with poor lymphatic circulation, body edema, tense and stiff muscles, or slow metabolism. It is also suitable for healthy individuals who pursue daily body management, wish to enhance overall firmness, and maintain a light and healthy physique. Before use, it is necessary to confirm that one's physical condition meets the treatment requirements.

Q3: Will there be any pain during the treatment process?

There is no pain throughout the entire process. During operation, the user only feels a gentle pressing and rolling sensation as the rollers contact the skin. In areas with long-term muscle tension, a slight soreness may be felt during the initial treatments; this is a normal reaction associated with meridian and lymphatic drainage. It can be alleviated by reducing the roller speed or decreasing the pressure. The soreness will gradually disappear as the body adapts.

Q4: Are there any side effects from using this device?

This device is a purely physical, non-invasive conditioning device with no obvious side effects. A small number of users may experience mild redness or a warm sensation in the treated area after operation; these are normal reactions to physical stimulation and require no special treatment, naturally subsiding within a few hours.

Q5: Can individuals operate the device at home by themselves?

Yes. This device features a user-friendly design with simple and easy-to-understand operating steps, supporting personal operation mode. It is suitable for use by professionals in beauty institutions as well as for individual home use. When using at home, simply follow the operating parameters, procedures, and precautions outlined in this manual strictly.

Q6: After edema improves, will it rebound?

The device works by activating the body's lymphatic and blood circulation systems, addressing the root cause of edema rather than merely providing superficial de-swelling. If a healthy lifestyle including a low-salt diet, adequate water intake, regular sleep, and moderate exercise is maintained after treatment, the edema will generally not rebound. If poor lifestyle habits are maintained long-term, edema may recur; regular maintenance treatments are recommended.

VIII. Warranty Terms

8.1 Warranty Period

1) The warranty period for the main unit of this product is 12 months.

2) The warranty period is determined by the date on the proof of purchase.
